Worksheet 2 Output

```
    Expects high loss for incorrect predictions.
    import numpy as np
    # Define correct predictions (low loss scenario)
    y_true_correct = np.array([[1, 9, 0], [0, 1, 0], [0, 0, 1]]) # True one-hot labels
    y_pred_correct = np.array([[1, 9, 0, 0.85, 0.05], [0.1, 0.85]) # High confidence in the correct class
    # Define incorrect predictions (high loss scenario)
    y_pred_incorrect = np.array([[0.95, 0.05, 0.9], # Highly confident in the wrong class
    # Compute loss for both cases [0.1, 0.05, 0.85], [0.85, 0.1, 0.05]])
    # Compute loss for both cases loss_correct = loss_softmax(y_pred_incorrect, y_true_correct)
    # Validate that incorrect predictions lead to a higher loss assert loss_correct < loss_incorrect, f"Test failed: Expected loss_correct < loss_incorrect, but got {loss_correct:.4f} >= (loss_incorrect:.4f)**
    # Print results print(f"cross-Entropy Loss (Correct Predictions): {loss_correct:.4f}**)
    Print(f"cross-Entropy Loss (Incorrect Predictions): (loss_correct:.4f)**)
    **Cross-Entropy Loss (Correct Predictions): 0.1435
    **Cross-Entropy Loss (Incorrect Predictions): 2.9957
```

```
# Example 1: Correct Prediction (Closer predictions)

X_correct = np.array([[1, 0, 0.0], [0.0, 1.0]]) # Feature matrix for correct predictions

Y_correct = np.array([[1, 0], [0, 1]]) # True labels (one-hot encoded, matching predictions)

W_correct = np.array([[1, 0, 1], 0.1]) # Bias for correct prediction

b_correct = np.array([[0.1, 0.1]) # Bias for correct prediction

# Example 2: Incorrect Prediction (Far off predictions)

X_incorrect = np.array([[1, 0.9], [0, 1]]) # Feature matrix for incorrect predictions

y_incorrect = np.array([[1, 0.9], [0, 1]]) # Feature matrix for incorrect predictions

y_incorrect = np.array([[1, 0.9], [0, 1]]) # Feature matrix for incorrect predictions

w_incorrect = np.array([[0.1, 0.9], [0.0, 0.3]]) # Weights for incorrect predictions

b_incorrect = np.array([[0.1, 0.9], [0.0, 0.3]]) # Weights for incorrect predictions

cost_correct = cost_softmax(X_correct, y_correct, w_correct, b_correct)

# Compute cost for correct predictions

cost_incorrect = cost_softmax(X_incorrect, y_correct, w_correct, b_incorrect)

# Check if the cost for incorrect predictions is greater than for correct predictions

assert cost_incorrect > cost_correct, f'rest failed: Incorrect cost {cost_incorrect} is not greater than correct cost {cost_correct} "

# Print the costs for verification

print("Cost for correct prediction:", cost_incorrect)

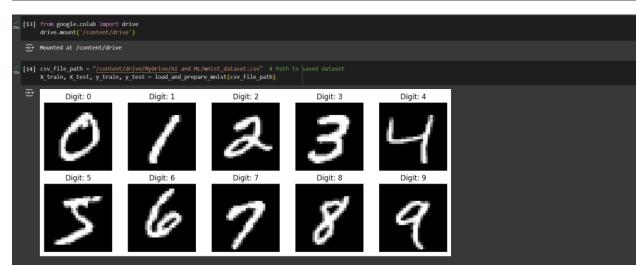

print("Cost for incorrect prediction:", cost_incorrect)

print("Test passed!")

**Cost for correct prediction: 0.0006234364133349324

Cost for incorrect prediction: 0.20930861359446115

Test passed!
```

```
✓ A Quick debugging Step:

[15] # Assert that X and y have matching lengths
    assert len(X_train) == len(y_train), f"Error: X and y have different lengths! X={len(X_train)}, y={len(y_train)}"

print("Move forward: Dimension of Feture Matrix X and label vector y matched.")

Move forward: Dimension of Feture Matrix X and label vector y matched.

✓ Train the Model:

[16] print(f"Training data shape: {X_train.shape}")
    print(f"Test data shape: {X_test.shape}")

Training data shape: (48000, 784)
    Test data shape: (12000, 784)
```
